Campus Event Manager

A Flutter-based College Event Management Application

Course: Flutter Hybrid Mobile Application Development

Overview

Campus Event Manager is a cross-platform Flutter mobile application that centralizes the discovery, registration, and notification of college events. Students frequently miss out on technical fests, workshops, seminars, and cultural programs because information is scattered across notice boards, WhatsApp groups, and social media, while organizers have no structured way to manage registrations. This app solves that gap with a single platform where organizers publish events and students browse, register, and get reminded automatically.

Key Features

- Secure student login/signup using Firebase Authentication
- Browse a live, searchable list of upcoming campus events
- View full event details with venue location shown on Google Maps
- Register for events through a validated form; registrations stored via REST API and local storage
- View and cancel registered events offline ("My Registrations")
- Push notifications remind students of upcoming registered events
- Organizers/admins can create, edit, and delete events with image banners

Technologies Used

Flutter (Dart) for the frontend; Provider/Riverpod for state management; SQLite/Hive/Shared Preferences for local storage; a Node.js/Express REST API for event data; Firebase Authentication, Cloud Firestore, and Firebase Cloud Messaging for cloud services and notifications; Google Maps Flutter Plugin for venue locations; and Git/GitHub for version control.

Expected Output

A fully functional Android/iOS application (delivered as an installable APK) with at least 6 screens, complete CRUD operations on events and registrations, working REST API and Firebase integration, offline access to registered events, and location- and notification-based features — ready for live demonstration.
